

NHIS BHAPC: Period and Cohort Effects Across Covariate Models

Cohort effects should visibly flatten from M1 to M4 if compositional changes explain the trend (90% CrI)

Model specifications: M1 Base = age + age² + log(weight); M2 = + education, race, sex; M3 = + K6; M4 = full model
Variance decomposition (Period / Cohort / Residual): M1: 0.1% / 0.5% / 99.4% | M2: 0.6% / 0.3% / 99.1% | M3: 0.2% / 0.1% / 99.7% | M4: 0.7% / 0.1% / 99.2%
